Gas Fees **Kill** AI Micropayments

Traditional blockchains make per-action AI pricing economically impossible

Gas Cost Problem

Each ETH transaction costs ~\$1.00 in gas. A \$0.003 AI task costs 333× more in fees than the service itself.

-\$997 loss / 1,000 txns

Latency Problem

AI agents need sub-second payment confirmation. Traditional chains take 12+ seconds for finality.

12+ seconds per tx

Arc Solution

Arc EVM L1 uses USDC as native gas token. Circle Nanopayments enable zero-gas micropayments.

~\$0.000001 per tx

Speed Solution

Arc confirms transactions in under 1 second. Real onchain settlement with Blockscout explorer verification.

≤ 0.51s finality

ECONOMIC PROOF

Why Traditional Gas Destroys This Model

Per-Action Pricing is the Future

AI agents need \$0.001–\$0.01 micropayments. No human will approve each transaction — it must be autonomous.

Arc Makes It Economically Viable

USDC as native gas token eliminates the fee paradox. The agent economy can actually generate profit.

Scales to Millions of Transactions

1M transactions/day = \$3,000 revenue on Arc vs. -\$1M loss on ETH mainnet.

COST COMPARISON — 1,000 TRANSACTIONS

METRIC	ETH MAINNET	ARC + CIRCLE
Gas per tx	~\$1.00	~\$0.000001
Revenue per tx	\$0.003	\$0.003
Gas total (1K)	\$1,000	\$0.001
Revenue total	\$3.00	\$3.00
Net Profit	-\$997 LOSS	+\$2.999 ✓

Verdict: Only Arc Makes This Viable

Traditional gas fees make AI micropayment economies impossible. Circle's Arc eliminates this barrier — turning machine-to-machine commerce from a concept into a real, profitable system.
